

How is the student's scientific work organized?

buy cheap essay

Student, by its nature, is a curious creature. He always loves to do something, create, violate the existing foundations, etc. Therefore, it is not for nothing at the time of study at the university, students are attracted to scientific activities. After all, science always required breakthrough ideas, crazy concepts to move on. Who, if not a young man, is capable of extraordinary?

In this regard, in the first year, students are invited to participate in some scientific conference, at first, as a listener. Then, as interests grow to scientific research, interested students are invited to take part in some conference as a speaker.

Thus, slowly chopping, a young man or a girl joining science. And now, the day is the day when they find their scientific interest and will replenish scientific stores through their own research, experiments and experiments.

All this is good, but the "green" freshman to all these scientific research, at the very beginning of his stay in the university, frankly, "to the light bulb". It is still in the stage of adaptation to new conditions, people and the rest. Therefore, he is hard to understand the mechanism of scientific work in the university itself.

I remember myself in the first year. Believe me, I did not think about any science. All my thoughts were only about current studies (as it were, everyone would not accomplish everything), well, and of course, about the student dining room (so that today to eat and with whom to sit down). I think most of the first holidays initially attend their stay at the university, about the same thoughts.

However, it will pass quite a bit of time, and you are already silent, you want to show your identity. Partly in this will help you scientific activities. At the same time, it is certainly not clear to you, as everything is functioning at all and according to which principle, for example, the participants of scientific conferences are chosen.

In fact, a lot of things are not clear at first. It is in order to help beginner Lomonosov to understand how scientific life is arranged at the university, this article was written.

So, then read carefully, for I will tell you all the secrets of the student's scientific life.

How are scientific conferences at the university?

After a meeting of SNO, as already mentioned above, a schedule of work is approved. This chart reflects all scientific events held in a particular academic year. Therefore, as soon as everything finishes, active work begins with the rest of the SNO.

Who are the rest of SNO? In essence, all students studying in all forms of training. Those. Any student, if desired, can become a member of the SNO. One of the main tasks of the SNO leaders is precisely the popularization of scientific activities among students.

-So-Popularization-Scientific-Activity-Among-Students

However, in fact, members of the SNO is a limited group of students, one way or another, interested in science. At the same time, even those students who have never been involved in SSO often become members of the SNO. They even have no idea that they are included in SMO.

Why is this happening? Everything is simple. University - institution, in most cases, state, and, therefore, included in the infinite omission of reports and inspections. Almost all state organizations are somehow trying to show the good performance of their activities.

Not exception is the university. Therefore, it is not to be surprised at some numbers in various statistical reports.
